Effects of ambient UV radiation on critical periods of reproduction of the beach mouse (*Peromyscus polionotus*). Adult beach mice in two populations were exposed to a daily dose of 20 kJ m<sup>-2</sup> during gestation and lactation. The experiment was conducted from mid-May to mid-September to evaluate the effects of UV radiation on reproduction of the species. Adult females in the peak-field population were found to be more sensitive to the deleterious effects of UV radiation than those in the flanks (P Recent advances in the neurobiology of cocaine. 1. Research over the past decade has revealed many ways in which cocaine influences the functions of the nervous system. In the hippocampus, cocaine disrupts memory, disrupts glutamate transmission in the nucleus accumbens, and suppresses the activity of tyrosine hydroxylase in the ventral tegmental area. These effects are the result of direct actions of cocaine on the brain. 2. Cocaine decreases the brain's ability to concentrate sodium in

---

the cortex and cerebellum. The effect is associated with the pharmacological effects of cocaine and may explain the absence of cocaine from alcohol-related problems. 3. Cocaine increases the release of catecholamines in the nucleus accumbens, but the effect varies with the dose and the length of time of cocaine exposure. This may explain some of the differences in the subjective effects of cocaine in different individuals. 4. Over the past decade, cocaine was shown to increase the release of dopamine in the nucleus accumbens. These findings may help to explain the reinforcing effects of cocaine. 5. Cocaine's ability to release dopamine was shown to be due to its ability to displace dopamine and serotonin from the vesicular transporter. This might explain cocaine's ability to enhance the excitability of the limbic system. Bassina Hudlicka Bassina Hudlicka (born May 4, 1999) is a Canadian female curler. 82157476af
